

The Explosion in New Data

And What it Means for Economic Development

Big Data and Algorithms and Spreadsheets, Oh My!

Introduction to GIS WebTech

- *Technology company focused exclusively on economic development*
- *Fastest-growing provider with the only technology built natively on Esri's ArcGIS platform*
- *Serve economic development organizations of all sizes, in all regions of the country*
- *Let's connect!*

Four Key Takeaways

GIS WebTech

- 1. Use of non-traditional data is exploding as costs for collecting, transmitting, analyzing and storing data collapse***
- 2. Businesses are using this data in increasingly sophisticated ways***
- 3. You must know the new data being used by the industries and businesses you are targeting...and provide it to them!***
- 4. Understanding your target industries' evolving data needs is now a permanent requirement of EDOs***

New Data Relevant to Economic Development

Demand Side: “Business-Pulled Data”

- *Businesses and site selectors, increasingly focused on a small number of critical issues like workforce, demand local data*
- *To compete and win, economic development organizations must provide data addressing these factors*
- *Leading EDOs are developing customized, local data sets in response to emerging business demand*

Supply Side: “Technology-Pushed Data”

- *Technological change essentially “pushes” new data into the market, creating new supply of data*
- *As this data becomes available, businesses find clever ways to use it*
- *These uses include location decisions*

Technology-Pushed Data: a Story of Collapsing Costs...

...to Collect Data...

- **Sensors and IoT**
- **Phones**
- **Apps**
- **Personal devices**

...to Transmit Data...

- **Cell**
- **Wifi**
- **Fiber**
- **APIs & Integration Tools**

...and to Store & Process Data

- **Cloud storage**
- **Cloud computing**
- **Machine learning**
- **AI**

Result: Data, Data and More Data!

Let's Consider Three Examples of Technology-Pushed Data

Social media data

Cell phone location data

Satellite imagery data

Social Media Data

1. Recent Historical Data

- Huge volumes of social media data are now mined using AI and other tools
- Information on what is trending for a given area is correlated to psychographic profiles, creating a profile or sketch of the people in the area
- These can, in turn, be directly related to popular segmentation schemes like Tapestry – allowing businesses a more detailed understanding than that available from traditional demographic data.

Obvious (and Big) Implications for Location Decisions!

Social Media Data

2. Real-Time Data

- Now being mined for real-time business decisions...
- ...everything from customized special offers to price setting to utility outages
- Increasingly useful in understanding how to optimize existing locations (think retention!)

Over Time This Data Will Become Used for Location Decisions

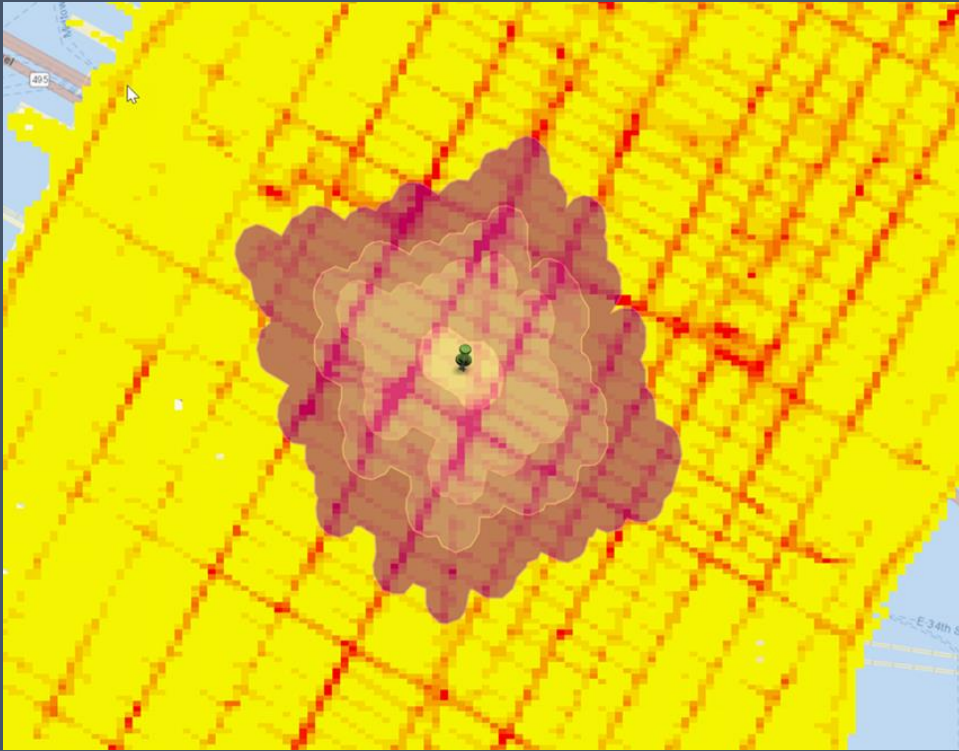

Cell Phone Location Data

- Part of broader category named “Human Weather” by Myles Sutherland, formerly of Esri
- Refers to high-volume data streams about human location—how and where people move
- Uses patterns to make predictions; hence the analogy to weather
- Infinite potential applications to business location and operation decisions. Some examples:
 - Documenting where customers originate and where they go when they leave
 - Geofencing with special offers for individuals entering and/or staying inside fence
 - When combined with IoT data from a product, provides geolocational understanding of how product is used

“I move; therefore I am.”

Haruki Murakami,
Japanese writer

Cell Phone Data Example: Foot Traffic

- Foot traffic density and walking times displayed from a potential retail site under consideration
- Data underlying this visualization allows predictive analytics on pedestrian traffic at site
 - How many people walk by the site during specific hours?
 - How many are within an easy walking distance that we can target via geofencing?
- When combined with demographic (e.g. income) and psychographic/segmentation data, provides input for a powerful predictive model for retail revenue

Satellite Imagery Data Example: Parked Car Counts

- AI can distinguish between a parked car and other objects in an image file
- AI takes image files and turns them into data
 - Counts of parked cars inside specific geofenced area
 - Counts with specific time stamps, etc.

- Counts are then used for business location decisions, especially in retail, and a host of other business decisions – like trading the securities of retailers!

Business-Driven Data Example: Workforce

- Always a major selection criterion, workforce is now the #1 issue for location decisions for most businesses
- Leading EDOs are responding by providing access to (1) local workforce data (skill-based data and not just occupational data) and (2) analysis tools

- Example: Business considering Oklahoma for a data and computing center
- Where are workers with computer skills concentrated in the state?
- Oklahoma City stands out
- Ok, but...

Business-Driven Data Example: Workforce, Cont'd.

- Now that I am concentrating on Oklahoma City, I want to see what the workforce looks like within a 45 minute commute time of a site I am considering

Commute Time in Brown

- The ability to visualize the intersection of commute time with areas of high workforce concentration is immensely helpful to businesses considering Oklahoma City
- And equally helpful in keeping Oklahoma City on the short list
- But...

Business-Driven Data Example: Workforce, Cont'd.

- I want to get quantified workforce data using these analytical tools, to feed into my models analyzing the economics of this site, e.g. labor costs, turnover, etc.

Commute Time in Brown

- Example: report showing workforce data from within specified walking times, driving times and trucking times

The image shows three overlapping screenshots of a GIS WebTech report titled "Demographic and Income Comparison Profile". The reports are for a 10-minute radius around a specific location (Latitude: 36.1411, Longitude: -96.7065). The reports are for the years 2010, 2017, and 2022. The data is presented in a table format with columns for the year, the metric, and the value.

Year	Metric	Value
2010 Summary	Population	1,182
	Households	717
	Families	331
	Average Household Size	3.60
	Owner Occupied Housing Units	486
	Renter Occupied Housing Units	229
2017 Summary	Population	1,234
	Households	773
	Families	340
	Average Household Size	3.29
	Owner Occupied Housing Units	486
	Renter Occupied Housing Units	287
2022 Summary	Population	1,314
	Households	823
	Families	360
	Average Household Size	3.22
	Owner Occupied Housing Units	526
	Renter Occupied Housing Units	300
Trends: 2017-2022 Annual Rate	Population	1.50%
	Households	1.15%
	Families	1.15%
	Median Household Income	3.03%

A Few Predictions

- Data and how it is changing site selection is today's trend
- Tomorrow's is technology, i.e. new ways to access and utilize the data
- A great example on the near-term horizon: Natural language query

“Put together a list of certified, undeveloped sites between 50 and 100 acres in the southeast with access to rail, a concentration of engineering professionals within a 45 minute commute time, and good quality of life ratings.”

- ❖ Software uses publicly available data and proprietary functionality
- ❖ Produces a “long list” of sites sorted by best match
- ❖ Software also makes recommendations you may not have considered

Four Key Takeaways

GIS WebTech

- 1. Use of non-traditional data is exploding as costs for collecting, transmitting, analyzing and storing data collapse***
- 2. Businesses are using this data in increasingly sophisticated ways***
- 3. You must know the new data being used by the industries and businesses you are targeting...and provide it to them!***
- 4. Understanding your target industries' data evolving data needs is now a permanent requirement of EDOs***
